

KETO-TEST

The most reliable and efficient detection tool for (sub)clinical ketosis in dairy cows. This device could be an interesting addition to line of animal health products.

Due to our advanced technology, the **eBketone VET** can detect ketones in the cow's blood in just **10** seconds with **highly accurate results at a cost effective price**.

The test results of the blood ketone meter are the **most accurate** from the current condition of the lactating cow which can be monitored from an early stage (and provide treatment if necessary), whereas the urine or milk ketone strips measure the excreted urine or milk at the end stage. The early diagnosis makes it possible to prevent ketosis from happening in the cows by intervention measures and prevent economic loss.
